

AHMET KOCA

Flutter Developer

I'm quite obsessed with writing clean code in Flutter, focusing on Clean Architecture and SOLID principles. I don't just draw on screens; I also add AI intelligence to applications using agents and my Python expertise. I've worked on asynchronous structures and AI integration in projects like DermaScope and Sting. My goal is to create not just functional, but truly scalable and intelligent products.

Work Experience

Flutter Web Developer (Star Scholar) - Tübitak 1001 Project

February 2025 - April 2026

In this project, I am developing a Flutter-based web application for the system. Simultaneously, on the backend side, I spent a considerable amount of time developing a clean and optimized structure using FastAPI and a RESTful architecture for data communication, mathematical model execution, and GNN implementation. I also had the opportunity to gain in-depth experience with GNN by voluntarily assisting in its development. Based on the outputs of all stages, I am meticulously improving key aspects such as the UI and UX. I also had the chance to participate in the technical analysis and preparation processes for an SCI article where the project findings were published.

Flutter Developer Intern - Texinsight Technology Inc.

February 2025 - November 2025

As a full-time Flutter Developer Intern at Newky, I worked on the UI and logic processes of a 9-screen application workflow using the MVVM architecture and Provider state management structure. I built a central navigation infrastructure with go_router and integrated live location tracking via the Google Maps API and QR Code Scanner modules into the application. During the development process, I also paid attention to performance optimization with flutter_hooks and responsive design with MediaQuery. I managed the project using the Agile (Kanban) methodology through Jira.

Projects

Dermoscope -AI-Powered Dermatology Application

In Dermoscope, which I developed with a team at the Artificial Intelligence and Technology Academy's graduation bootcamp, I created a mobile health solution that integrates CNN-based deep learning models with the Google Gemini API in a hybrid structure to perform skin and hair analyses. I built a RESTful backend architecture using FastAPI. I managed all processes, from UI/UX design to database schema, from a "full-stack" perspective.

Stayzi - Short-Term Home Rental App

I designed the technical infrastructure for an end-to-end marketplace platform that digitizes short-term accommodation processes. Using Flutter, I optimized the application for high-performance operation on iOS and Android platforms. While working on asynchronous booking flows and secure payment system integration, I took active responsibility in all stages of the software lifecycle, managing the requirements analysis, system design, and technical presentation processes.

Areas of Expertise

- Flutter & Dart Development
- Clean Architecture & SOLID
- AI Agents (LangGraph & LLM)
- FastAPI & RESTful API
- Deep Learning (CNN & GNN)
- State Management (Provider, Riverpod, Bloc)
- Firebase & Cloud Solutions

Languages

- Turkish (Native Language)
- English (B1 Level)

Awards

- Next2Green Design Competition – University Category First Place (October 2025)
